(STRD ) UNIV LELAND STANFORD JUNIOR. Clayberger C, Krensky AM; WPI; 1995-194027/25. Compsns. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

human-leucocyte-associated antigens. This sequence represents the HIA-B2702 84-79-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HIA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HIA-B2702.60-84 (see AAR95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate

AAR95413, and AAR95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the

compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.

Peptides AAW33784-98 and AAW33778-9 were assayed for their

This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or estexified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc immunomodulating activity. A peptide-type compound or variant is claimed combined which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, cc and/or C-terminal amidated or esterified forms of up to 60 amino acids, cc where the peptide-type compound comprises the formula; A-B, where A, B = CC (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = CC (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa84 = a hydrophobic or cc small amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid. Sequences in the brackets may optionally be absent or truncated cat any peptide type bond within the brackets. The compounds comprise can any acid sequences related to a Class I HLA-B alphal domain (positions CC amino acid sequences related to a Class I HLA-B alphal domain (positions CC undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in creamons are or for treating autoinmune diseases. a c. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a represents amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid; The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA.B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptides or proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.

AAR95413, and AAR95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the than 82702 84-75-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. P74 is found in a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see AAR95416), induces calcium influx, and inhibits Compsns. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs. Example; Page 12; 29pp; English.

                           ö
cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by audding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                     Gaps

Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient 

Example 15; Page 36; 80pp; English.

of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments

                                                                                                                                               cc amino acids, where the peptide-type compound comprises the formula; A-B, cwhere A, B = (R aa76-771) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or CC V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84= a cC hydrophobic or small amino acid; aa82 = R or I; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be CC absent or truncated at any peptide type bond within the brackets. The CC compounds comprise amino acid sequences related to a class I HLA-B CC alphal domain (positions 79-84). They can be used to inhibit cytotoxic C I-lymphocytes (CTL) from undesirably attacking cells in a host or in CC virto. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the CC used for preventing rejection of transplants or for treating autoimune CC diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. CC The products can also be used for detection and diagnosis.

This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; the class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-771) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, Sor N; aa79 = R or G, aa80 = I or N, aa81, a848 = a hydrophobic or amil amino acid; aa82 = R or L; aa83 = G or R; and ar expresents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undestrably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection or fransplants or for treating autoimmune diseases, e.g. diabetes, the cheumatoid arthritis and lupus erythematosis. The products can also be the manner of the companies of transplants or for treating autoimmune diseases, e.g. diabetes, the manner of the companies of the companies or proteins or the products can also be the custom and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunomodulating dimer; immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                           New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunomodulating dimer peptide(s) - based on a Class I HLA-B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide B2702.84-75/75-84T tested for immunomodulating activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                 of class I major introductions and ANKY2V07-R22914 represent fragments sequence is an inverted diner of residues 75-84 of the alpha-1 domain the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly of the patient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = CR aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = CD, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise condesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, red additional activities and lupus erythematosis. The products can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC human-leucocyte-associated antigens. This sequence represents the CC HLM-B2702 84-75T/75-84T palindrome. These sequences can be used to consider the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein CC HsC70. p74 is found in a limited number of cell types, but is CC particularly expressed on B and T cells. p74 can be isolated by lysis CC of a suitable cell with an amphoteric detergent, and then passed through CC an affinity column containing a covalently bound HLM-B2702 palindromic CC peptide. Compositions comprising the extracellular fragment of p74 CC combined with HLM-B2702.60-84 (see AAR95416), induces calcium influx, CC and inhibits cytoroxic Tlymphocyte (CTL) differentiation or cytolysis. CC andidate compounds can be screened for their effect on the cytolytic CC activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound CC and p74. Modulation of CTL activity can be 'inhibited in a cellular CC composition containing T-cells and antigen presenting cells (APCs), by sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Major histocompatibility complex class 1; MHC 1; cell receptor; alpha 1 domain; peptide [Ala81]-Dk-(69-85); interaction modulation; arthritis; neoplasias; lupus erythematosus.
          AAR71424-R71438 are human major histocompatibility complex class 1 (MHC 1) alpha 1 domain derived peptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human MHC 1 alpha 1 domain peptide [Ala81]-Dk-(69-85)

                                                                                                                        밁
                                                                                                                                               ş
                                                                                                                                                                                                                                                    CC AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic contrivity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) CC collynucleotides may be used to produce the secreted (I), by inserting CC polynucleotides may be used to produce the secreted (I), by inserting CC diagnose and treat immune/haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK54942 to AAK54950 and AAM82169 CC represent sequences used in the exemplification of the present invention.
                                                                                                                                                                           Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-R2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosupressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or exterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                     Claim 16;
                                                                                                                                                                                                                                                                                                                                                     New immunomodulating dimer peptide(s) - based on alpha-1 domain, used for preventing rejection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Beulow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24-MAY-1996;

                                                    compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.

CC AAR95413, and AAR95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the CC HLA-B2702 8479-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane CC protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. CC p14 is found in a limited number of cell types, but is particularly CC expressed on B and T cells. p74 can be isolated by lysis of a suitable CC column containing a covalently bound HLA-B2702 palindromic peptide. CC Column containing a covalently bound HLA-B2702 palindromic peptide. CC Compositions comprising the extracellular fragment of p74 combined with CC CMB0581008 (See AAR95416), induces calcium influx, and inhibits CC cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate CC compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and containing the amount of binding between the candidate compound and Compsns. comprising lymphoid surface membrane proteins inhibit cytolytic activity and differentiation of CTLs. immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = 10 (R aa76-77) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D. S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise anino acid sequences related to a Class I HiA-B alphal domain (positions or any peptide type bond within the tytotoxic T-lymphocytes (CTL) from anino acid sequences related to a Class I HiA-B alphal domain (positions or used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in captivate CTLs. They can also inhibit the proliferation of T cells in captomate anti-CD3. The peptide can be used for preventing rejection of transplants or for transing auttoimmune diseases, e.g. diabetes, response to anti-CD3. The peptide can be used for preventing artheritis and lupus erythematosis. The products can also be the custom and diagnosis.
                                                                                                                                                                                 1;
p74... Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunomodulating dimer; immunosuppressant drug; CTL activation;

This sequence represents a specifically claimed immunomodulating
dimer peptide of the invention. A peptide-type compound or variant is
claimed which has immunomodulating activity, including the N-terminal
caylated and/or C-terminal amidated or esterified forms of up to 60
amino acids, where the peptide-type compound comprises the formula; A-B,
where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or
V; aa77 = L), S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = E
Aydrophobic or small amino acid. The sequence in the brackets may optionally be
absent or truncated at any peptide type bond within the brackets. The
compounds comprise amino acid sequences related to a Class I HLA-B
alphal domain (positions 79-84). They can be used to inhibit cytotoxic
T-lymphocytes (CTL) from undesirably attacking cells in a host or in
vitro. They can also be used in combination with antigenic peptides or
proteins of interest to activate CTLs. They can also inhibit the
cused for preventing rejection of transplants or for treating autoining
the second of transplants or for treating autoining

                                                                                                          agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                Sequence
                                                                                                                                                                                                                                          bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical
                                                                                                                                                                                                                                                                                                                           The invention relates to a spatially-addressable set of single exonuncial acid probes for measuring gene expression in a sample derived mean breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label
                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 27;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-496933/54.

                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exor nucleic acid probe of the invention.
                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                            Claim 27; SEQ ID NO 27436; 639pp + sequence listing; English

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                Single exon nucleic acid probes for analyzing gene expression in human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21515-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genome-derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              which are derived from genomic sequences expressed in the human arrow. They can be used to measure gene expression in bone marrow s, which may enable the improved diagnosis and treatment of cancers s lymphoma, leukaemia and myeloma. The present sequence is a n encoded by one of the probes of the invention.

                                                                          The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not specification, but was obtained in electronic for at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefor useful in grading and/or staging of diseases of the cervix, notably cervical cancer.
                                                                                                                                             Claim 27; SEQ ID No 28583; 654pp; English.

```
The present invention relates to novel single exon nucleic acid probes (see AA10010-AA110067). The present sequence is a peptide encoded by one such probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a predicting, diagnosing, staging, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                 Probe; human; breast disease; breast cancer; development disorder; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  breast disease and non-carcinoma tumours.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel single exon nucleic acid probe used to measuring gene expression in a human breast -
                                                                                                Peptide #2225 encoded by probe for measuring breast gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   53.4%; Score 31; DB 22; Length 28; 70.0%; Pred. The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method in the above mentioned microarray; assigning exons to a single exon tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons in the sistence and contact of the exons in the tissues and/or cell types using hybridisation cell types indicates that the exons a new indicates that the exons a new indicates that the exons a new indicates that the exons and the and a single exon and the account of the exons in the tissues and/or cell types indicates that the exons and exons in the tissues and/or cell types indicates that the exons and expense and the account of the exons in the tissues and or cell types indicates that the exons a new exons and the account of the exons and the account of the exons and the account of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the exons should be assigned to a single gene; a perification of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (LID), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease,
                                                                                                                                             Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; asrcoidosis; pulmonary haemosiderosis; pulmonary histicoytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           measure gene expression in human lung samples -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 27; SEQ ID No 27190; 634pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic
                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
